Aims and Scope
Today, software development is conducted in increasingly turbulent business environments. Typically, fast-changing and unpredictable markets, complex and changing customer requirements, pressures of shorter time-to-market, and rapidly advancing information technologies are characteristics found in most software development projects. To address this situation, agile practices advocate flexibility, efficiency and speed. While many software development companies have indeed succeeded in adopting agile practices in parts of their organisation, the focus for many organisations is predominantly at the team level. The other functions in the organisation, including customer relations, product management, R&D management and software release, in many companies still work in traditional slow cycles, measured in months and years.

Continuous software engineering refers to the organisational capability to develop, release and learn from software in rapid parallel cycles, typically hours, days or very small numbers of weeks. This includes determining new functionality to build, prioritising the most important functionality, evolving and refactoring the architecture, developing the functionality, validating it, releasing it to customers and collecting experimental feedback from the customers to inform the next cycle of development.

Reaching this goal requires crosscutting research which spans from the area of process and organisational aspects in software engineering to the individual phases of the software engineering lifecycle and finally to live experimentation to evaluate different system alternatives by users feedback. Consequently, the workshop aims to bring the research communities of the aforementioned areas together to exchange challenges, ideas, and solutions to bring software engineering a step further to being a holistic continuous process.

RCoSE 2015 is co-located with ICSE 2015, the International Conference on Software Engineering (see http://2015.icse-conferences.org), in Florence, Italy. RCoSE will be a highly interactive workshop with a strong emphasis on discussions.

Topics of Interest
As a summary, topics relevant to the scope of the workshop include rapid continuous software engineering as described above and specifically the following:

- agile practices
- relations between agile practices and the specific development phases, e.g., requirements engineering, architectural design, programming languages, validation and verification
- organisational aspects of agile processes
- tools supporting continuous software engineering
- application / system monitoring
- live and automatic experimentation and quick feedback of experimental results
- usability / human computer interaction
- software evolution
- software maintenance

Paper Submission Details
We are soliciting full research papers (up to 7 pages) and position papers (up to 4 pages). Full research papers present original and evaluated research whereas position papers describe novel ideas, identified challenges, or experiences related to the workshop’s theme. The paper has to follow ICSE 2015 formatting and submission instructions:
http://2015.icse-conferences.org/submission-guidelines

Please submit your abstract and paper using the EasyChair page for the workshop:
https://www.easychair.org/conferences/?conf=rcose2015

Special issue
The authors of the best papers of the workshop will be invited to submit a revised and extended version of their paper to a special issue in the Journal of Systems and Software subject to further review.
